## Editorial Notes

*Development of Calcutta:* The paper on this subject by Sri K. B. Banerjee published in our December issue of 1961. Vol. XXXVI No. 4 has been well received and we have had a request from a well known publication for permission to reproduce it. This paper was only an introduction containing the Historical element. The technical aspects and problems needing solution will be dealt with in later issues as time and space permit. In this issue we are unable to include any portion of it. But in the next issue we shall publish another portion relating to drainage problems of the City Water Supply and power problems will follow later on.

We have for publication in this issue a descriptive article on the use of Welding for joining materials of construction in fabrication. Within the last ten years there has been a vast development in the devices, processes and mechanical appliances for the convenience, economy, and increase in out put of welding; Tests and methods of testing have been codified and adopted for ensuring safety of welded structures; Electrodes of various types of composition have been developed to suit a variety of materials and a large amount of scattered technical as well as descriptive literature on various aspects of the subject has been published in various publications. A well organized collection of these may be of some value to members. With this end in view we publish this articles presented to us by Sri K. G. K. Rao.
