Abstract

Present paper is an overview of marine and estuarine mollusc of West Bengal coast, based on recent surveys and the published literature. The checklist consists of Gastropoda, Scaphopoda, Bivalve and Cephalopoda available in and around the marine and estuarine waters of West Bengal coast. In total 301 species are enlisted, belongings to 184 genera, 89 families and 26 orders under four classes. Also, the paper includes the 5 species which are new record to the West Bengal coast.

Keywords: Checklist, Coastal Fauna, Conservation, Malacological Diversity

Introduction

India having more than seven thousand kilometers long coast line belongings to the peninsular India and two Island group, the Andaman & Nicobar and Lakshadweep. The West Bengal having 157 km long coast line (without considering the coastal length of creeks and River Islands) along northern part of east coast of India on Bay of Bengal. The river Ganga and Brahmaputra meets to the Bay of Bengal at Sundarban to form numbers of River Islands and creeks. The coast line consists of mudflats and mangrove ecosystem of Sundarban and wide intertidal area of sandy beaches at Bokhali to Digha. Exploration of mollusc of West Bengal coast started in late 19th and early 20th century, i.e. malacology of lower Bengal by Stoliczka (1869), brackishwater mollusc from outskirt of Culcutta and port Canning by Nevill (1880), Annandale (1907, 1922), Eliot (1910), Preston (1915) and Annandale and Prashad (1919, 1921). Eerstwhile major contribution on Indian marine mollusc is by Subba Rao (2003, 2017), Ramakirshna and Dey (2010) and Dey (2016). During the regular survey along the coast authors have collected large number of molluscan fauna and deposited them at Marine Aquarium and Regional Centre and documented. The present study

provides most updated list of molluscan diversity of West Bengal coast and some total numbers of 301 species are recorded to this locality including gastropoda, bivalvia, scaphopoda and cephalopoda. Numerous studies have already been made for the inventorisation the marine and estuarine molluscan faunal diversity of West Bengal coast by Subba Rao *et al.* (1983, 1992, 1995), Choudhury *et al.* (1984), Chandrasekhara Rao and Misra (1986), Mandal and Nandi (1989), Goswami (1992), Khan (2003), Ramakrishna *et al.* (2003), Khalua *et al.* (2003), Dey *et al.* (2005), Dey and Mitra (2005), Dey (2006), Roy *et al.* (2008), Chakraborty (2010), Yennawar and Tudu (2014), and Tudu *et al.* 2017a and b). The present paper summarises all the reports along with the authors original work and represents a complete upto date checklist of marine and estuarine malacofauna of West Bengal.

Material and Methods

The 157 km long coast line of West Bengal is surveyed for faunal exploration, and 8 localities are selected for the study i.e. Bokhali (21° 33' N and 088° 15' E), Fraserganj (21° 33' N and 088° 14' E), Sagar Island (21° 37' N and 088° 04' E), Dariapur (Petuaghata) (21° 47' N and 087° 53' E), Mondarmoni (21° 39' N and 087° 42' E), Tajpur

*Author for correspondence

(21° 38' N and 087° 38' E), Shankarpur (21° 38' N and 087° 34' E) and Digha (21° 37' N and 087° 31' E). Along with these localities, adjoining areas are surveyed and the live molluscs as well as dead shells are collected. The live specimens are preserved in the 4% formaldehyde solution and dead shells are kept dry in plastic boxes. Voucher specimens were deposited at the Marine Aquarium and Regional Centre, Zoological Survey of India (collection by P.C. Tudu). The identification was made based on their morphological characters and classification of Bouchet and Rocroi (2005), Bieler *et al.* (2010) and Vecchione *et al.* (1998) is followed for gastropods, bivalve, scaphopoda and cephalopoda respectively. Also, the specimens which were reported by previous workers are incorporated from different available literatures and included in the checklist.

Results

After examining the all collections of West Bengal coast and reviewing the available literature, an updated

checklist has been presented and only the species with valid names are enlisted. In this list 301 species belonging to 184 genera, 89 families, 26 orders and four classes are enlisted (Table 1). The highest number of species belongs to gastropoda (151 species), followed by bivalvia (137 species), and cephalopoda (10 species), and scaphopoda having three species. The present study reveals the first record of 5 species from West Bengal coast i.e. *Ergaea walshi* (Reeve, 1859), *Eunaticina papilla* (Gmelin, 1791), *Nassarius pullus* (Linnaeus, 1758), *Diplodonta satparaensis* Preston, 1915 and *Dosinia areolata* Römer, 1870 of family Calyptraeidae, Naticidae, Nassariidae, Ungulinidae and Veneridae respectively and all the species are collected from Digha coast (marked with asterisk * in Table 1). The Veneridae family of class Bivalvia is dominating this coast with 23 species belonging to 15 genera and followed by Mactridae family with 17 species and Tellinidae and Neritidae family with each 15 species. Present study reveals that this coast is very rich in molluscan diversity.

Discussion

The coast of West Bengal is considerable of marine and estuarine characteristics, the important morphotype of deltaic Sundarban and mudflats, sandy beaches, sand dunes, creeks and river Islands. The some freshwater species i.e. *N. violacea* (Gmelin, 1791), *Neritina smithi* Wood, 1828, *Neripteron cornucopia* (Benson, 1836) of family Neritidae, *Bellamya bengalensis* (Lamarck, 1822),

B. dissimilis (Muller, 1774) *B. crassa* (Benson, 1836) of family Viviparidae, *Stenothyra blanfordiana* Nevill, 1880, *S. deltae* (Benson, 1836), *S. minima* (G.B. Sowerby I, 1837) of family Stenothyridae, *Thiara lineata* Gray, 1828, *T. granifera* (Lamarck, 1822), *T. scabra* (O.F. Müller, 1774), *T. paludomidea* (Nevill, 1884), *T. tuberculata* (O.F. Müller, 1774) of family Thiaridae and bivalve species like *Polymesoda bengalensis* (Lamarck, 1818) and *Corbicula stratela Deshayes*, 1854, *C. bensoni* Deshayes, 1854 of

family Cyrenidae are included in this list, though these species are some time inhabiting the estuarine brackish water. The incidence of freshwater mollusc found in estuarine habitat like Sundarban region including Hugli Matla riverine complex happens due to become low salinity during monsoon, hence some freshwater species are available in this coast. The effort is given to get rid of the synonyms and the valid names are enlisted and synonyms are given along with reference for particular species.
